# Neural Networks Graphs Cheat Sheet

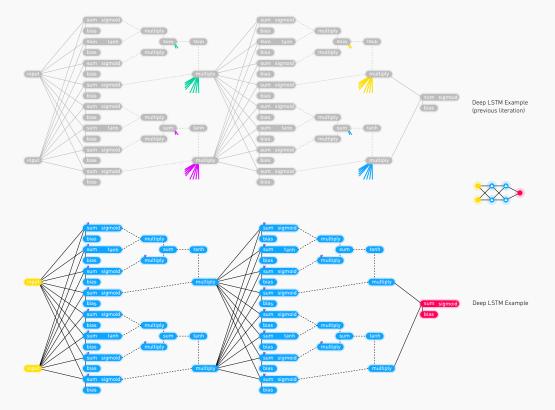

**BecomingHuman.Al** 

# MachineLearning Overview **MACHINE LEARNING IN EMOJI**

# **BecomingHuman.Al**

# **BASIC REGRESSION**

linear model.LinearRegression() Lots of numerical data

human builds model based on input / output

human input, machine output human utilizes if satisfactory

human input, machine output human reward/punish, cycle continues

# **CLUSTER ANALYSIS**

on centroids

cluster.KMeans() Similar datum into groups based

# covariance.EllipticalEnvelope()

# Finding outliers through grouping

# **CLASSIFICATION**

neural network.MLPClassifier()

Complex relationships. Prone to overfitting Basically magic.

neighbors.KNeighborsClassifier()

Group membership based on proximity

**DECISION TREE** tree.DecisionTreeClassifier()

If/then/else. Non-contiguous data. Can also be regression.

ensemble.RandomForestClassifier()

Find best split randomly Can also be regression

svm.SVC() svm.LinearSVC()

Maximum margin classifier. Fundamental Data Science algorithm

GaussianNB() MultinominalNB() BernoulliNB

Updating knowledge step by step with new info

# **FEATURE REDUCTION**

# **T-DISTRIB STOCHASTIC NEIB EMBEDDING**

manifold.TSNE()

Visual high dimensional data. Convert similarity to joint probabilities

# **PRINCIPLE COMPONENT ANALYSIS**

decomposition.PCA()

Distill feature space into components that describe greatest variance

# **CANONICAL CORRELATION ANALYSIS**

decomposition.CCA()

Making sense of cross-correlation matrices

# LINEAR **DISCRIMINANT ANALYSIS**

Linear combination of features that separates classes

# **OTHER IMPORTANT CONCEPTS**

**BIAS VARIANCE TRADEOFF** 

**UNDERFITTING / OVERFITTING** 

**INERTIA** 

**ACCURACY FUNCTION**

# **Cheat-Sheet Skicit learn** Phyton For Data Science

BecomingHuman.Al DataCamp

# **Skicit Learn**

Skicit Learn is an open source Phyton library that implements a range if machine learning, processing, cross validation and visualization algorithm using a unified

# A basic Example

- >>> from sklearn import neighbors, datasets, preprocessing
- >>> from sklearn.cross validation import train test split
- >>> from sklearn.metrics import accuracy score
- >>> iris = datasets.load \_iris() >>> X, y = iris.data[:, :2], iris.target
- >>> Xtrain, X test, y\_train, y test = train\_test\_split (X, y, random stat33)
- >>> scaler = preprocessing.StandardScaler().fit(X\_train)
- >>> X train = scaler.transform(X train)
- >>> X test = scaler transform(X test)
- >>> knn = neighbors.KNeighborsClassifier(n\_neighbors=5)
- >>> knn.fit(X\_train, y\_train)
- >>> y\_pred = knn.predict(X\_test)
- >>> accuracy score(y test, y pred)

# **Prediction**

#### Supervised Estimators

>>> y\_pred = svc.predict(np.random.radom((2,5))) >>> v pred = lr.predict(X test) >>> y\_pred = knn.predict\_proba(X\_test)

Unsupervised Estimators

Predict labels in clustering algos

Predict lahels

Predict labels

# **Loading the Data**

Your data beeds to be nmueric and stored as NumPy arrays or SciPy sparse matric, other types that they are comvertible to numeric arrays, such as Pandas Dataframe, are also

>>> import numpy as np >> X = np.random.random((10,5)) >>> y = np . array ( PH', IM', 'F', 'F' , 'M', 'F', 'NI', 'tvl' , 'F', 'F', 'F' )) >>> X [X < 0.7] = 0

# **Preprocessing The Data**

## Standardization

- >>> from sklearn.preprocessing import StandardScaler
- >>> scaler = StandardScaler().fit(X train)
- >>> standardized\_X = scaler.transform(X\_train)
- >>> standardized\_X\_test = scaler.transform(X\_test)

#### Normalization

- >>> from sklearn.preprocessing import Normalizer
- >>> scaler = Normalizer().fit(X\_train)
- >>> normalized X = scaler.transform(X train)
- >>> normalized X test = scaler transform(X test)

# **Binarization**

- >>> from sklearn.preprocessing import Binarizer
- >>> binarizer = Binarizer(threshold=0.0).fit(X)
- >>> binary X = binarizer.transform(X)

# **Encoding Categorical Features**

- >>> from sklearn preprocessing import Imputer
- >>> imp = Imputer(missing\_values=0, strategy='mean', axis=0)
- >>> imp.fit transform(X train)

## Imputing Missing Values

>>> from sklearn.preprocessing import Imputer >>> imp = Imputer(missing\_values=0, strategy='mean', axis=0)

>>> imp.fit\_transform(X\_train)

# **Generating Polynomial Features**

>>> from sklearn.preprocessing import PolynomialFeatures >>> poly = PolynomialFeatures(5)

>>> poly.fit\_transform(X)

# **Evaluate Your** Model's Performance

## **Classification Metrics**

#### Accuracy Score

- >>> from sklearn.metrics import accuracy\_score
- >>> accuracy\_score(y\_test, y\_pred)

### Classification Report

>>> from sklearn.metrics import classification\_report >>> print(classification\_report(y\_test, y\_pred))

# Confusion Matrix

>>> from sklearn.metrics import confusion matrix >>> print(confusion matrix(v test. v pred))

# **Regression Metrics**

## Mean Absolute Error

- >>> from sklearn.metrics import mean absolute error >>> y true = [3, -0.5, 2]
- >>> mean\_absolute\_error(y\_true, y\_pred)

### Mean Squared Error

- >>> from sklearn.metrics import mean squared error
- >>> mean\_squared\_error(y\_test, y\_pred)

#### R<sup>2</sup> Score

>>> from sklearn.metrics import r2 score >>> r2 score(y true, y pred)

# **Clustering Metrics**

>>> from sklearn metrics import adjusted rand score >>> adjusted\_rand\_score(y\_true, y\_pred)

#### Homogeneity

- >>> from sklearn.metrics import homogeneity\_score
- >>> homogeneity\_score(y\_true, y\_pred)

#### V-measure

- >>> from sklearn.metrics import v\_measure\_score
- >>> metrics.v\_measure\_score(y\_true, y\_pred)

#### **Cross-Validation**

- >>> from sklearn.cross validation import cross val score
- >>> print(cross\_val\_score(knn, X\_train, y\_train, cv=4))
- >>> print(cross val score(lr, X, y, cv=2))

# **Model Fitting**

### Supervised learning

- >>> lr.fit(X, y)
- >>> knn.fit(X\_train, y\_train)
- >>> svc.fit(X train. v train)

# Unsupervised Learning

>>> pca\_model = pca.fit\_transform(X\_train)

Fit the model to the data Fit to data, then transform it

Fit the model to the data

# **Create Your Model**

# **Supervised Learning Estimators**

## Linear Regression

- >>> from sklearn.linear\_model import LinearRegression >>> Ir = LinearRegression[normalize=True]
- Support Vector Machines (SVM)
- >>> from sklearn.svm import SVC >>> svc = SVC[kernel='linear']

## Naive Baves

>>> from sklearn.naive\_bayes import GaussianNB >>> gnb = GaussianNB()

Estimator score method

Precision recall f1-score

and support

- >>> from sklearn import neighbors
- >>> knn = neighbors.KNeighborsClassifier(n\_neighbors=5)

# **Unsupervised Learning Estimators**

#### Principal Component Analysis (PCA)

- >>> from sklearn decomposition import PCA
- >>> pca = PCA(n\_components=0.95)

- >>> from sklearn.cluster import KMeans
- >>> k means = KMeans(n\_clusters=3, random\_state=0)

# **Training And Test Data**

- >> from sklearn.cross validation import train\_test\_split
- >> X train, X test, y train, y test train\_test\_split(X,

#### random state-0)

# **Tune Your Model**

## Grid Search

- >>> from sklearn.grid\_search import GridSearchCV
- >>> params = {"n\_neighbors": np.arange(1,3)
- 'metric": ["euclidean","cityblock"]} >>> grid = GridSearchCV(estimator=knn,
- param\_grid=params)
- >>> grid.fit(X train, v train)
- >>> print(grid.best score )
- >>> print(grid.best\_estimator\_.n\_neighbors)

## **Randomized Parameter Optimization**

- >>> from sklearn.grid\_search import RandomizedSearchCV
- >>> params = {"n\_neighbors": range(1,5), "weights": ["uniform", "distance"]}
- >>> rsearch = RandomizedSearchCV(estimator=knn,

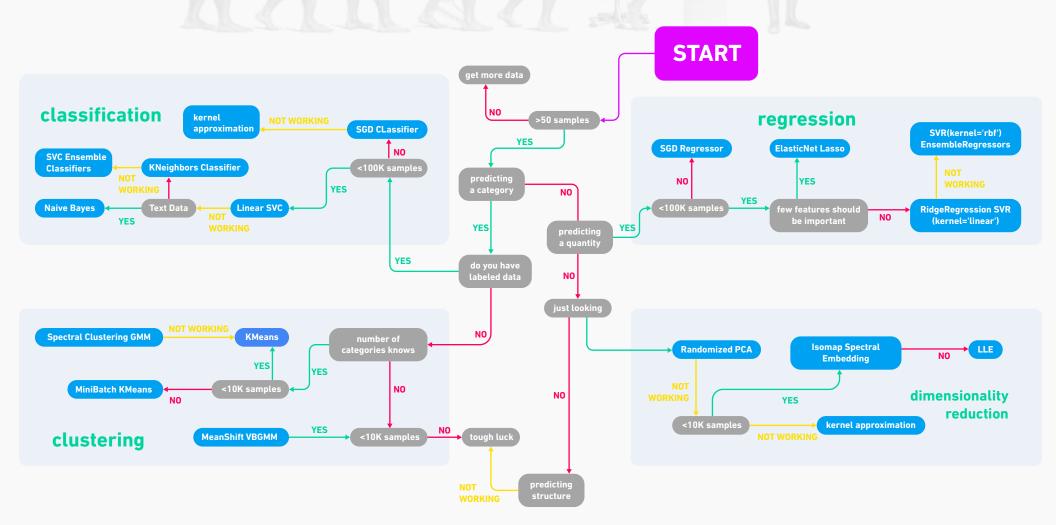

param distributions=params,

n\_iter=8, random state=5)

- >>> rsearch.fit(X train, y train)
- >>> print(rsearch.best score )

# **Skicit-learn Algorithm**

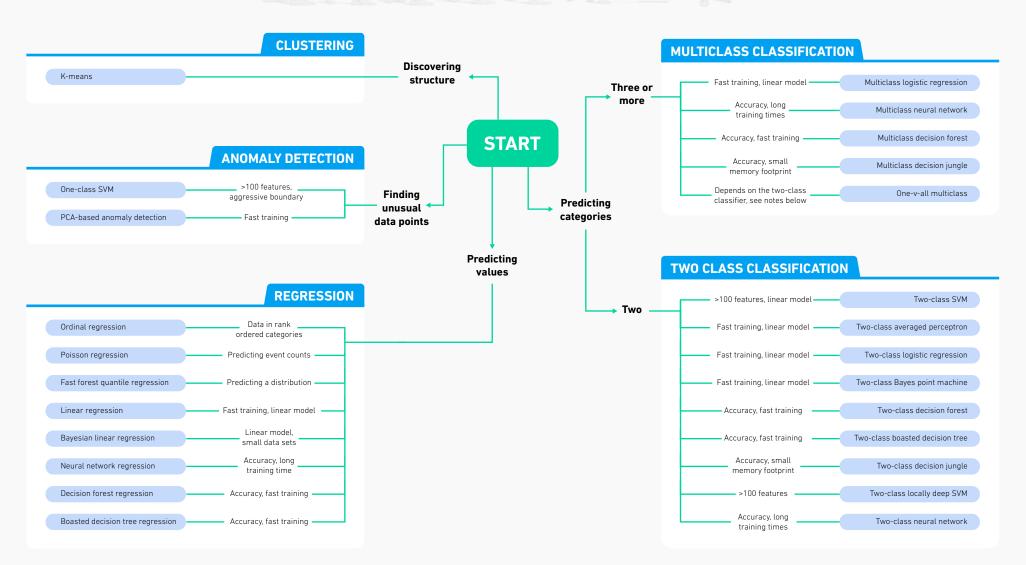

# **BecomingHuman.Al**

# **Algorithm** Cheat Sheet

# **BecomingHuman.Al**

This cheat sheet helps you choose the best Azure Machine Learning Studio algorithm for your predictive analytics solution. Your decision is driven by both the nature of your data and the question you're trying to answer.

# **Tensor Flow** Cheat Sheet

# BecomingHuman.Al

# Installation

# How to install new package in Python

Example: pip install requests

# How to install tensorflow?

sudo pip install

#### How to install Skflow

update ~/.keras/keras.json - replace "theano" by "tensorflow"

# Info

#### **TensorFlow**

to 11.5 petaflops.

TensorFlow™ is an open source software library created by Google for numerical computation and large scale computation. Tensorflow bundles together Machine Learning, Deep learning models and frameworks and makes them useful by way of common metaphor.

In May 2017 Google

second-generation of

announced the

TensorFlow the TPU, as well as

the availability of the TPUs in

up to 180 teraflops of perfor-

Google Compute Engine.[12] The

second-generation TPUs deliver

mance, and when organized into

clusters of 64 TPUs provide up

## Keras

#### Keras is an open sourced neural networks library, written in

Python and is built for fast experimentation via deep neural networks and modular design. It is capable of running on top of TensorFlow, Theano, Microsoft Cognitive Toolkit, or PlaidML.

Scikit Flow is a high level interface base on tensorflow which can be used like sklearn. You can build you own model on your own data quickly without rewriting extra code provides a set of high level model classes that you can use to easily integrate with your existing Scikit-learn pipeline code.

python\_version = cp27/cp34

https://storage.googleapis.com/tensorflow/linux/\$device/ten-

### How to install Keras

# Helpers

# Python helper Important functions

Get object type

Get help for object (list of available methods, attributes, signatures and so on)

Get list of object attributes (fields, functions)

#### str(object)

Transform an object to string object? Shows documentations about the object

Return the dictionary containing the current scope's global variables.

Update and return a dictionary containing the current scope's local variables

Return the identity of an object. This is guaranteed to be unique among simultaneously existing objects.

# dir( huiltin )

## Main classes

TensorFlowClassifier

TensorFlowRegressor

TensorFlowDNNRegressor

# Each classifier and regressor have following fields n\_classes=0 (Regressor), n\_classes are expected to be input (Classifier)

TensorFlowRNNClassifier - there is 50

learning rate=0.1.

# Each class has a method fit

fit(X, v, monitor=None, loadir=None

X: matrix or tensor of shape [n samples, n features...]. Can be iterator that returns arrays of features. The training input samples for fitting the model.

Y: vector or matrix [n\_samples] or [n\_samples, n\_outputs]. Can be iterator that returns array of targets. The training target values (class labels in classification, real numbers in

monitor: Monitor object to print training progress and invoke early stopping

logdir: the directory to save the log file that can be used for optional visualization.

#### predict (X, axis=1, batch\_size=None)

X: array-like matrix, [n\_samples, n\_features...] or iterator. axis: Which axis to argmax for classification.

By default axis 1 (next after batch) is used. Use 2 for sequence

batch\_size: If test set is too big, use batch size to split it into mini batches. By default the batch\_size member variable is

y: array of shape [n\_samples]. The predicted classes or

# Python For Data Science Cheat Sheet

# **PySpark - RDD Basics**

BecomingHuman.Al

PySpark is the Spark Python API that exposes the Spark programming model to Python.

# Initializing Spark

# **SparkContext**

>>> from pyspark import SparkContext >>> sc = SparkContext(master = 'local[2]')

# **Calculations With Variables**

Retrieve SparkContext version >>> sc.pythonVer Retrieve Python version Path where Spark is installed on >>> str(sc.sparkHome) Retrieve name of the Snark User >>> str(sc.sparkUser()) running SparkContext >>> sc.appName Return application name >>> sc.applicationId Retrieve application ID >>> sc.defaultParallelism Return default level of parallelism >>> sc.defaultMinPartitions Default minimum number of partitions for RDDs

# Configuration

>>> from pyspark import SparkConf, SparkContext >>> conf = (SparkConf() setMaster("local") .setAppName("My app")

.set("spark.executor.memory", "1q")) >>> sc = SparkContext(conf = conf)

# Configuration

In the PySpark shell, a special interpreter-aware SparkContext is already created in the variable called sc.

\$ ./bin/spark-shell --master local[2]

\$./bin/pyspark --master local[4] --py-files code.py

Set which master the context connects to with the --master argument, and add Python .zip, .egg or .py files to the runtime path by passing a comma-separated list to --py-files.

# **Loading Data**

# **Parallelized Collections**

>>> rdd = sc.parallelize([('a',7),('a',2),('b',2)]) >>> rdd2 = sc.parallelize([('a',2),('d',1),('b',1)]) >>> rdd3 = sc.parallelize(range(100)) >>> rdd4 = sc.parallelize([("a",["x","y","z"]), ("b",["p", "r"])])

## **External Data**

Read either one text file from HDFS, a local file system or or any Hadoop-supported file system URI with textFile(), or read in a directory of text files with whole Text Files().

>>> textFile = sc.textFile("/my/directory/\*.txt") >>> textFile2 = sc.wholeTextFiles("/my/directory/")

# **Selecting Data**

# Getting

>>> rdd.collect() Return a list with all RDD elements [('a', 7), ('a', 2), ('b', 2)] >>> rdd.take(2) Take first 2 RDD elements >>> rdd.first() Take first RDD element >>> rdd.top(2) Take top 2 RDD elements Sampling

>>> rdd3.sample(False, 0.15, 81),collect() [3,4,27,31,40,41,42,43,60,76,79,80,86,97

Return sampled subset of rdd3

# Filtering

>>> rdd.filter(lambda x: "a" in x) .collect() [('a'.7),('a'.2)] >>> rdd5.distinct().collect() ['a',2,'b',7] >>> rdd.keys().collect()

Filter the RDD Return distinct RDD values Return (key, value) RDD's keys

# Iterating

#### Getting

>>> def g(x): print(x) >>> rdd.foreach(g)

# Retrieving RDD Information

# **Basic Information**

>>> rdd.getNumPartitions() List the number of partitions >>> rdd.count() Count RDD instances >>> rdd.countByKey()
defaultdict(<type 'int'>,{'a':2,'b':1}) Count RDD instances by key >>> rdd.countByValue() Count RDD instances defaultdict(<type 'int'>,{('b',2):1,('a',2):1,('a',7):1}) >>> rdd.collectAsMap() Return (key,value) pairs as a >>> rdd3.sum() Sum of RDD elements Sum of RDD elements >>> sc.parallelize([]).isEmpty() Check whether RDD is empty

# Summary

>>> rdd3.max() Maximum value of RDD elements >>> rdd3.min() Minimum value of RDD elements Mean value of RDD elements >>> rdd3.mean() >>> rdd3.stdev() 28.866070047722118 Standard deviation of RDD elements >>> rdd3.variance() 833.25 Compute variance of RDD elements >>> rdd3.histogram(3) ([0,33,66,99],[33,33,34]) Compute histogram by bins >>> rdd3.stats() Summary statistics (count, mean,

# **Reshaping Data**

# Reducing

>>> rdd.reduceByKey(lambda x,y : x+y) .collect() each key [('a',9),('b',2)] Merge the rdd values for >>> rdd.reduce(lambda a, b: a + b)
('a',7,'a',2,'b',2) Merge the rdd values

## Grouping by

>>> rdd3.groupBy(lambda x: x % 2) .mapValues(list) Return RDD of grouped values .collect() >>> rdd.groupByKey() Group rdd by key .mapValues(list) .collect() [('a',[7,2]),('b',[2])]

# Aggregating

>>> rdd foldBvKev(f) add)

.collect()

>>> segOp = (lambda x.v; (x[0]+v,x[1]+1)) Aggregate RDD elements of each partition and then the results >>> comb0p = (lambda x,y:(x[0]+y[0],x[1]+y[1]))Aggregate values of each RDD key >>> rdd3.aggregate((0,0),seqOp,combOp) Aggregate the elements of each 4950 partition, and then the results >>> rdd.aggregateByKey((0,0),seqop,combop) .collect() [('a',(9,2)), ('b',(2,1))] Merge the values for each key >>> rdd3.fold(0.add)

[('a',9),('b'.2)] >>> rdd3.kevBv(lambda x: x+x) Create tunies of RDD elements by collect() applying a function

# **Applying Functions**

>>> rdd.map(lambda x: x+(x[1],x[0])) Apply a function to each RDD element .collect() [('a',7,7,'a'),('a',2,2,'a'),('b',2,2,b')] >>> rdd5 = rdd.flatMap(lambda x: Apply a function to each RDD x+(x[1],x[0])ent and flatten the result >>> rdd5.collect()
['a',7,7,'a',a',2,2,'a',b',2,2,'b']

>>> rdd4.flatMapValues(lambda x: x) Apply a flatMap function to each (kev.value)pair of rdd4 without .collect() [('a',x'),('a',y'),('a',z'),('b',p'),('b',r')]

**Mathematical Operations** 

>>> rdd.subtract(rdd2) Return each rdd value not contained .collect() in rdd2 [('b',2),('a',7)] >>> rdd2.subtractByKey(rdd) Return each (key, value) pair of rdd2 .collect() [('d', 1)] with no matching key in rdd >>> rdd.cartesian(rdd2).collect() Return the Cartesian product

# Sort

>>> rdd2.sortBy(lambda x: x[1]) Sort RDD by given function >>> rdd2.sortByKey() Sort (key, value) RDD by key .collect() [('a',2),('b',1),('d',1)]

# **Reshaping Data**

>>> rdd.repartition(4) New RDD with 4 partitions >>> rdd.coalesce(1) Decrease the number of partitions in the

# Saving

>>> rdd.saveAsTextFile("rdd.txt") >>> rdd.saveAsHadoopFile ("hdfs://namenodehost/parent/child", 'org.apache.hadoop.mapred.TextOutputFormat')

# Stopping SparkContext

>>> sc.stop()

of rdd and rdd2

# Execution

\$./bin/spark-submit examples/src/main/python/pi.py

# NumPy Basics Cheat Sheet

# BecomingHuman.Al

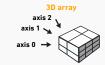

The NumPy library is the core library for scientific computing in Python. It provides a high-performance multidimensional array object, and tools for working with these arrays.

1D array

2D array

# **Creating Arrays**

>>> a = np.array([1,2,3]) >>> b = np.array([(1.5,2,3), (4,5,6)], dtype = float) >>> c = np.array([[(1.5,2,3), (4,5,6)], [(3,2,1), (4,5,6)]],dtype = float)

# **Initial Placeholders**

>>> np.zeros((3,4))	Create an array of zero
>>> np.ones((2,3,4),dtype=np.int16)	Create an array of one
>>> d = np.arange(10,25,5)	Create an array of evenly space values (step value
>>> np.linspace(0,2,9)	Create an array of event spaced values (number of samples
>>> e = np.full((2,2),7)	Create a constant arra
>>> f = np.eye(2)	Create a 2X2 identity matri
>>> np.random.random((2,2))	Create an array with random value
>>> np.empty((3,2))	Create an empty arra

# Saving & Loading On Disk

>>> np.save('my\_array', a) >>> np.savez('array.npz', a, b) >>> np.load('my\_array.npy')

# Saving & Loading Text Files

>>> np.loadtxt("myfile.txt") >>> np.genfromtxt("my\_file.csv", delimiter=",") >>> np.savetxt("myarray.txt", a, delimiter=" ")

# **Inspecting Your Array**

>>> a.shape	Array dimensions
>>> len(a)	Length of array
>>> b.ndim	Number of array dimensions
>>> e.size	Number of array elements
>>> b.dtype	Data type of array elements
>>> b.dtype.name	Name of data type
>>> b.astype(int)	Convert an array to a different type

# **Data Types**

	A STATE OF THE PARTY OF THE PAR
>> np.int64	Signed 64-bit integer types
>> np.float32	Standard double-precision floating point
>> np.complex	Complex numbers represented by 128 floats
>> np.bool	Boolean type storing TRUE and FALSE
>> np.object	Python object type values
>> np.string_	Fixed-length string type
>> np.unicode_	Fixed-length unicode type

# Asking For Help

>>> np.info(np.ndarray.dtype)

# **Array Mathematics**

# **Arithmetic Operations**

	THI THING TO POT MITE
Subtraction	>>> g = a - b array([[-0.5, 0. , 0. ], [-3. , -3. , -3. ]])
Subtraction	>>> np.subtract(a,b)
Addition	>>> b + a array([[ 2.5, 4., 6. ], [ 5., 7., 9. ]])
Addition	>>> np.add(b,a)
Division	>>> a / b array([[ 0.66666667, 1. , 1. ], [ 0.25 , 0.4 , 0.5 ]])
Division	>>> np.divide(a,b)
Multiplication	>>> a * b array([[ 1.5, 4. , 9. ], [ 4. , 10. , 18. ]])
Multiplication	>>> np.multiply(a,b)
Exponentiation	>>> np.exp(b)
Square root	>>> np.sqrt(b)

>>> a.mean()	Mean
>>> b.median()	Median

# Copving Arrays

Create a view of the array with the same data >>> h = a.view( >>> np.copy(a) Create a copy of the array >>> h = a.copy() Create a deep copy of the array

# **Sorting Arrays**

>>> a.sort() Sort an array Sort the elements >>> c.sort(axis=0) of an array's axis

# Subsetting, Slicing, Indexing

Subsetting	
>>> a[2]	1 2 3 Select the element at the 2nd index
>>> b[1,2] 6.0	1.5 2 3 Select the element at row 1 column 2 (equivalent to b[1][2])
Slicing	
>>> a[0:2] array([1, 2])	1 2 3 Select items at index 0 and 1
>>> b[0:2,1] array([ 2., 5.])	1.5 2 3 4 5 6
>>> b[:1] array([[1.5, 2., 3.]])	1.5 2 3 Select all items at row 0
>>> c[1,] array([[[ 3., 2., 1.], [ 4., 5., 6.]]])	Same as (1,)
>>> a[::-1] array([3, 2, 1])	Reversed array a
Boolean Indexing	
>>> a[a<2] array([1])	1 2 3 Select elements from a less than 2
Fancy Indexing	
>>> b[[1, 0, 1, 0],[0, 1, 2, 0]] array([ 4. , 2. , 6. , 1.5])	<b>Select elements</b> (1,0),(0,1),(1,2) <b>and</b> (0,0)
>>> b[[1, 0, 1, 0]][.[0,1,2,0]] array([[4,.5, 6, 4, ], [1,5, 2, .3, .1,5], [4, 5, .6, .4, ], [1,5, 2, .3, .1,5]])	Select a subset of the matrix's rows and columns

# **Array Manipulation**

# **Transposing Array**

>>> i = np.transpose(b) Permute array dimensions >>> i.T Permute array dimensions

# **Changing Array Shape**

>>> b.ravel() Flatten the array >>> g.reshape(3,-2) Reshape, but don't change data

# Adding/Removing Elements

>>> h.resize((2,6)) Return a new array with shape (2,6) >>> np.append(h,g) Append items to an array Insert items in an array >>> np.insert(a, 1, 5) >>> np.delete(a,[1]) Delete items from an array

# **Splitting Arrays**

>>> np.hsplit(a,3) [array([1]),array([2]),array([3])] index

Split the array

>>> np.vsplit(c,2) Split the array [array([[[ 1.5, 2., 1.], [ 4., 5., 6.]]]),

# **Combining Arrays**

>>> np.concatenate((a,d),axis=0) array([ 1, 2, 3, 10, 15, 20]) Concatenate arrays >>> np.vstack((a,b)) Stack arrays vertically (row-wise) array([[ 1. , 2. , 3. ], [ 1.5, 2. , 3. ], [ 4. , 5. , 6. ]]) >>> np.r\_[e,f] Stack arrays vertically (row-wise) >>> np.hstack((e,f)) array([[ 7., 7., 1., 0.], [ 7., 7., 0., 1.]]) Stack arrays horizontally >>> np.column\_stack((a,d)) array([[ 1, 10], Create stacked

>>> np.c\_[a,d] Create stacked column-wise arrays

# **Bokeh** Cheat Sheet

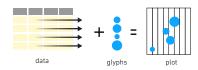

# **BecomingHuman.Al**

# Data Types

The Python interactive visualization library Bokeh enables high-performance visual presentation of large datasets in modern web browsers

Bokeh's mid-level general purpose bokeh.plotting interface is centered around two main components; data and glyphs

The basic steps to creating plots with the bokeh.plotting

- 1. Prepare some data:
- Python lists, NumPy arrays, Pandas DataFrames and other sequences of values
- 2. Create a new plot
- 3. Add renderers for your data, with visual customizations
- 4. Specify where to generate the output
- 5 Show or save the results

# Data

Also see Lists, NumPv & Pandas

Under the hood, your data is converted to Column Data Sources. You can also do this manually:

>>> import numpy as np >>> import pandas as pd

>>> df = pd.DataFrame(np.array([[33.9,4,65, 'US'], [32.4,4,66, 'Asia'], [21.4,4,109, 'Europe']]),

columns=['mpg',cyl', 'hp', 'origin'], index=['Toyota', 'Fiat', 'Volvo'])

>>> from hokeh models import ColumnDataSource

>>> cds\_df = ColumnDataSource(df)

# **Plotting**

>>> from bokeh.plotting import figure >>> p1 = figure(plot\_width=300, tools='pan,box\_zoom') >>> p2 = figure(plot\_width=300, plot\_height=300, x\_range=(0, 8), y\_range=(0, 8)) >>> p3 = figure()

# Show or Save Your Plots

>>> show(p1) >>> show(layout) >>> save(p1) >>> save(layout)

# **Renderers & Visual Customizations**

# **Glyphs**

#### Scatter Markers

>>> p1.circle(np.array([1,2,3]), np.array([3,2,1]), fill color='white') >>> p2.square(np.array([1.5,3.5,5.5]), [1,4,3],

color='blue', size=1)

#### Line Glyphs

>>> p1.line([1,2,3,4], [3,4,5,6], line\_width=2) >>> p2.multi line(pd.DataFrame([[1,2,3],[5,6,7]]), pd.DataFrame([[3,4,5],[3,2,1]]),

# **Rows & Columns Layout**

#### Rows

>>> from bokeh.lavouts import row >>> layout = row(p1,p2,p3)

#### Columns

>>> from bokeh.layouts import columns >>> layout = column(n1 n2 n3)

## Nesting Rows & Columns

>>>layout = row(column(p1,p2), p3)

## **Grid Lavout**

- >>> from bokeh.layouts import gridplot
- >>> row1 = [p1,p2]>>> row2 = [n3]
- >>> layout = gridplot([[p1,p2],[p3]])

# Legends

#### Legend Location

### Inside Plot Area

>>> p.legend.location = 'bottom\_left'

#### Outside Plot Area

>>> r1 = p2.asterisk(np.array([1,2,3]), np.array([3,2,1])

>>> r2 = p2.line([1.2.3.4], [3.4.5.6])

>>> legend = Legend(items=[("One", [p1, r1]),("Two", [r2])], location=(0, -30))

>>> p.add\_layout(legend, 'right')

# **Customized Glyphs**

# Selection and Non-Selection Glyphs

>>> p = figure(tools='box\_select' >>> p.circle('mpg', 'cyl', source=cds\_df, selection color='re nonselection\_alpha=0.1)

### Hover Glyphs

>>> hover = HoverTool(tooltips=None, mode='vline') >>> p3.add tools(hover)

#### Colormapping

>>> color\_mapper = CategoricalColorMapper(

factors=['US', 'Asia', 'Europe'],

palette=['blue', 'red', 'green']) >>> p3.circle('mpg', 'cyl', source=cds\_df,

color=dict(field='origin', transform=color\_mapper),

# legend='Origin'))

# **Linked Plots**

## Also see data

Also see data

#### Linked Axes

>>> p2.x range = p1.x range >>> p2.y\_range = p1.y\_range

## **Linked Brushing**

>>> p4 = figure(plot\_width = 100, tools='box\_select,lasso\_select')

>>> p4.circle('mpg', 'cyl', source=cds\_df)

>>> p5 = figure(plot\_width = 200, tools='box\_select,lasso\_select')

# Tabbed Layout

>>> from bokeh.models.widgets import Panel, Tabs

>>> tab1 = Panel(child=p1, title="tab1") >>> tab2 = Panel(child=p2, title="tab2")

>>> layout = Tabs(tabs=[tab1, tab2]) **Legend Orientation** 

>>> p.legend.orientation = "horizontal"

>>> p.legend.orientation = "vertical"

#### Legend Background & Border

>>> p.legend.border line color = "navv" >>> p.legend.background\_fill\_color = "white"

# Output

# Output to HTML File

>>> from bokeh.io import output file, show >>> output file('my bar chart.html', mode='cdn')

## **Notebook Output**

>>> from bokeh.io import output\_notebook, show >>> output notebook()

# Standalone HTML

>>> from bokeh.embed import file html >>> html = file html(p, CDN, "my\_plot")

# Components

>>> from bokeh.embed import components >>> script div = components(n)

# **Statistical Charts** With Bokeh

Also see Data

#### Bokeh's high-level bokeh.charts interface is ideal for quickly creating statistical charts

# >>> from bokeh charts import Bar

>>> p = Bar(df, stacked=True, palette=['red;'blue'])

>>> from bokeh.charts import BoxPlot >>> p = BoxPlot(df, values='vals', label='cyl', legend='bottom\_right')

>>> from bokeh.charts import Histogram >>> p = Histogram(df, title='Histogram')

# Scatter Plot

marker='square

>>> from bokeh.charts import Scatter >>> p = Scatter(df, x='mpg', y ='hp',

xlabel='Miles Per Gallon',

# **Keras** Cheat Sheet

# **BecomingHuman.Al**

Keras is a powerfuland easy-to-use deep learning library for Theano and TensorFlow that provides a high-level neural networks API to develop and evaluate deep learning models.

# A Basic Example

>>> import numpy as no

>>> from keras.models import Sequential

>>> from keras.layers import Dense

>>> data = np.random.random((1000.100))

>>> labels = np.random.randint(2,size=(1000,1))

>>> model = Sequential()

>>> model add(Dense(32

input\_dim=100))

>>> model.add(Dense(1, activation='sigmoid'))

>>> model.compile(optimizer='rmsprop',

loss='binary crossentropy'.

metrics=['accuracy'])

# Data

Also see NumPv. Pandas & Scikit-Learn

Your data needs to be stored as NumPy arrays or as a list of NumPy arrays. Ideally, you split the data in training and test sets, for which you can also resort to the train\_test\_split module of sklearn.cross\_validation.

## **Keras Data Sets**

>>> from keras.datasets import boston\_housing, cifar10,

>>> (x train.v train).(x test.v test) = mnist.load data()

>>> (x\_train2,y\_train2),(x\_test2,y\_test2) = boston\_housing.load data()

>>> (x train3,y train3),(x test3,y test3) = cifar10.load data()

>>> (x\_train4,y\_train4),(x\_test4,y\_test4) = imdb.load\_data(num\_words=20000)

>>> num\_classes = 10

>>> model.fit(data,labels,epochs=10,batch\_size=32)

>>> predictions = model.predict(data)

#### Other

>>> from urllib.request import urlopen

>>> data = np.loadtxt(urlopen("http://archive.ics.uci.edu/ ml/machine-learning-databases/pima-indians-diabetes.data").delimiter=".")

>>> X = data[:.0:8]

>>> y = data [:,8]

# **Model Architecture**

# Sequential Model

>>> from keras models import Sequential

>>> model = Sequential()

>>> model2 = Sequential()

>>> model3 = Sequential()

## Multilaver Perceptron (MLP)

#### Binary Classification

>>> from keras.layers import Dense

>>> model.add(Dense(12, input\_dim=8, kernel\_initializer='uniform',

activation='relu'))

>>> model.add(Dense(8,kernel initializer='uniform',activation='relu')) >>> model.add(Dense(1,kernel\_initializer='uniform',activation='sigmoid'))

#### **Multi-Class Classification**

>>> from keras.layers import Dropout

>>> model.add(Dense(512,activation='relu',input\_shape=(784,)))

>>> model.add(Dropout(0.2))

>>> model.add(Dense(512.activation='relu'))

>>> model.add(Dropout(0.2)) >>> model.add(Dense(10.activation='softmax'))

>>> model.add(Dense(64.activation='relu'.input\_dim=train\_data.shape[1]))

>>> model add(Dense(1))

## **Convolutional Neural Network (CNN)**

>>> from keras.layers import Activation,Conv2D,MaxPooling2D,Flatten

>>> model2.add(Conv2D(32,(3,3),padding='same',input\_shape=x\_train.shape[1:]))

>>> model2 add(Activation('relu'))

>>> model2.add(Conv2D(32,(3,3)))

>>> model2.add(Activation('relu'))

>>> model2.add(MaxPooling2D(pool\_size=(2,2)))

>>> model2.add(Dropout(0.25))

>>> model2.add(Conv2D(64,(3,3), padding='same'))

>>> model2.add(Activation('relu'))

>>> model2.add(Conv2D(64.(3, 3)))

>>> model2.add(Activation('relu'))

>>> model2.add(MaxPooling2D(pool\_size=(2.2))) >>> model2.add(Dropout(0.25))

>>> model2.add(Flatten())

>>> model2.add(Dense(512))

>>> model2 add(Activation('relu'))

>>> model2.add(Dropout(0.5))

>>> model2.add(Dense(num\_classes)) >>> model2.add(Activation('softmax'))

# **Recurrent Neural Network (RNN)**

>>> from keras.klavers import Embedding.LSTM

>>> model3.add(Embedding(20000,128))

>>> model3.add(LSTM(128,dropout=0.2,recurrent\_dropout=0.2))

>>> model3.add(Dense(1,activation='sigmoid'))

# **Inspect Model**

>>> model.output shape

>>> scaler = StandardScaler().fit(x train2)

>>> standardized\_X = scaler.transform(x\_train2)

>>> standardized\_X\_test = scaler.transform(x\_test2)

# **Pandas Basics Cheat Sheet**

BecomingHuman.Al

Use the following import convention: >>> import pandas as pd

The Pandas library is built on NumPy and provides easy-to-use data structures and data analysis tools for the Python programming language.

# **Pandas Data Structures**

# Series

#### A one-dimensional

labeled array a capable of holding any

>>> s = pd.Series([3, -5, 7, 4], index=['a', 'b', 'c', 'd'])

## **Data Frame**

A two-dimensional labeled data structure with columns of potentially different

>>> data = {'Country': ['Belgium', 'India', 'Brazil'], 'Country': ['Belgium', 'India', 'Brazil'],

'Capital': ['Brussels', 'New Delhi', 'Brasília'],

'Population': [11190846, 1303171035n207847 >>> df = pd.DataFrame(data,

columns=['Country', 'Capital', 'Population'])

# **Dropping**

>>> s.drop(['a', 'c']) >>> df.drop('Country', axis=1)

Drop values from rows (axis=0) Drop values from columns(axis=1)

# Sort & Rank

>>> df.sort\_index() >>> df.sort\_values(by='Country') >>> df.rank()

Sort by labels along an axis Sort by the values along an axis Assign ranks to entries

Median of values

# Retrieving Series/ **DataFrame Information**

>>> df shane (rows.columns) Describe index >>> df index >>> df.columns Describe DataFrame columns >>> df infn() Info on DataFrame >>> df count() Number of non-NA values

## Summarv

>>> df median(

>>> df.sum() Sum of values >>> df.cumsum() Cummulative sum of values >>> df.min()/df.max() Minimum/maximum values >>> df.idxmin()/df.idxmax() Minimum/Maximum index value >>> df.describe() Summary statistics >>> df.mean() Mean of values

# Selection

Also see NumPy Arrays

# Getting

>>> s['b'] Get one element >>> df[1:] Get subset of a DataFrame Population Country Capital New Delhi 1303171035

# Selecting, Boolean Indexing & Setting

#### By Position

Select single value by row & >>> df.iloc[[0],[0]] 'Belgium' >>> df.iat([0],[0])

# By Label

Select single value by row & >>> df.loc[[0], ['Country']] 'Belgium' >>> df.at([0], ['Country']) 'Belgium'

#### By Label/Position

>>> df.ix[2] Country Capital Brasília Population 207847528 Select a single column of >>> df.ix[:,'Ca 0 Brussels 1 New Delhi 2 Brasília >>> df.ix[1,'Capital']
'New Delhi' Select rows and columns

# **Boolean Indexing**

Series s where value is not >1 >>> s[~(s > 1)] >>> s[(s < -1) | (s > 2)] s where value is <-1 or >2 >>> df[df['Population']>1200000000] Use filter to adjust DataFrame

# Setting

Set index a of Series s to 6 >>> s['a'] = 6

# **Asking For Help**

>>> help(pd.Series.loc)

# **Applying Functions**

>>> f = lambda x: x\*2 Apply function >>> df.apply(f) >>> df.applymap(f) Apply function element-wise

# **Data Alignment**

# **Internal Data Alignment**

# NA values are introduced in the indices that don't overlap:

>>> s3 = pd.Series([7, -2, 3], index=['a', 'c', 'd']) >>> s + s3 a 10.0 b NaN

## **Arithmetic Operations with Fill Methods**

You can also do the internal data alignment yourself with the help of the fill methods:

>>> s.add(s3, fill\_value=0) a 10.0 **b -5.0** >>> s.sub(s3, fill value=2) >>> s.div(s3, fill\_value=4)

# 1/0

## Read and Write to CSV

>>> pd.read csv('file.csv', header=None, nrows=5) >>> df.to\_csv('mvDataFrame.csv')

## Read and Write to Excel

>>> pd.read excel('file.xlsx')

>>> pd.to\_excel('dir/myDataFrame.xlsx', sheet\_name='Sheet1')

## Read multiple sheets from the same file

>>> xlsx = pd.ExcelFile('file.xls') >>> df = pd.read excel(xlsx, 'Sheet1')

# Read and Write to SQL Query or Database Table

>>> from sqlalchemy import create\_engine

>>> engine = create\_engine('sqlite:///:memory:') >>> pd.read\_sql("SELECT \* FROM my\_table;", engine) >>> pd.read\_sql\_table('my\_table', engine)

>>> pd.read sql\_query("SELECT \* FROM my\_table;", engine)

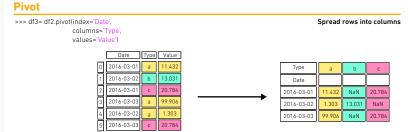

read sql()is a convenience wrapper around read sql table() and read\_sql\_query()

>>> pd.to\_sql('myDf', engine)

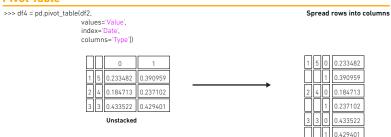

# **Pandas Cheat Sheet**

BecomingHuman.Al

# **Pandas Data Structures**

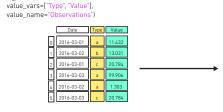

# **Pivot Table**

# Melt

>>> pd.melt(df2,

id\_vars=["Date"],

Gather columns into rows

Stacked

	Date	Variable	Observations

# Data Wrangling with pandas Cheat Sheet

# Syntax Creating DataFrames

	a	b	С
1	4	7	10
2	5	8	11
3	6	9	12

## df = pd.DataFrame( {"a" : [4 ,5, 6], "b": [7, 8, 9]. "c": [10, 11, 12]},

index = [1, 2, 3]) Specify values for each column.

#### df = nd DataFrame( [[4, 7, 10], [5, 8, 11], [6. 9. 12]]. index=[1, 2, 3], columns=['a', 'b', 'c']) Specify values for each row

		a	b	С
n	v			
Ī	1	4	7	10
d	2	5	8	11
е	2	6	9	12

#### df = pd.DataFrame( {"a":[4,5,6], "b":[7.8.9]. "c" : [10, 11, 12]}. index = pd.MultiIndex.from\_tuples( [('d',1),('d',2),('e',2)], names=['n''v']))

Create DataFrame with a MultiIndex

# Method Chaining

Most pandas methods return a DataFrame so that another pandas method can be applied to the result. This improves readability of code. df = (pd.melt(df)

.rename(columns={ 'variable' · 'var' 'value' : 'val'}) .query('val >= 200')

# Windows

#### df.expanding()

Return an Expanding object allowing summary functions to be applied cumulatively.

## df.rolling(n)

Return a Rolling object allowing summary functions to be applied to windows of length n.

# Windows

#### df nlot hist() Histogram for each column

df plot scatter(x='w' v='h') Scatter chart using pairs of noints

# BecomingHuman.Al Tidy Data A foundation for wrangling in pandas

is saved in its

own column

data set:

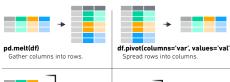

Tidy data complements pandas's vectorized operations. pandas will automatically preserve observations as you manipulate variables. No other format works as intuitively with pandas

# Reshaping Data Change the layout of a data set

is saved in its

own row

Append columns of DataFrames

# df.sort values('mpg')

Order rows by values of a column (low to high)

#### df.sort\_values('mpg',ascending=False) Order rows by values of a column (high to low).

df.rename(columns = {'y':'year'}) Rename the columns of a DataFrame

#### df.sort index()

Sort the index of a DataFrame

#### df reset index()

Reset index of DataFrame to row numbers moving index to columns.

# df.drop(columns=['Length','Height'])

# Subset Observations (Rows

#### df[df.Length > 7]Extract rows that meet

logical criteria.

Append rows of DataFrames

# df.drop duplicates()

Remove duplicate rows (only considers columns)

# df.head(n)

Select first n rows

# df tail(n)

Select last n rows

Windows

## df sample(frac=0.5) Randomly select fraction

of rows

#### df.sample(n=10) Randomly select n rows.

df.iloc[10:20]

Select rows by position

#### df.nlargest(n. 'value') Select and order top n entries

df.nsmallest(n, 'value') Select and order bottom

#### Logic in Python (and pandas)

<	Less than	!=	Not equal to
>	Greater than	df.column.isin(values)	Group membership
==	Equal to	pd.isnull(obj)	Is NaN
<=	Less than or equal to	pd.notnull(obj)	Is not NaN
>=	Greater than or equal to	&, ,~,^,df.any(),df.all(	Logical and, or, not,
			xor, any, all

All of the summary functions listed above can be applied to a group.

agg(function)

Size of each group. Aggregate group using function.

# Subset Variables (Columns

# df[['width','length','species']]

Select multiple columns with specific names

# df['width'] or df.width

Select single column with specific name.

#### df.filter(regex='regex')

Select columns whose name matches regular expression regex

Logic in Python (and pandas) Matches strings containing a period

# 'Length\$

Matches strings ending with word 'Length'
Matches strings beginning with the word 'Sepal'
Matches strings beginning with 'x and ending with 1,2,3,4,5
Matches strings except the string 'Species' ^x[1-5]\$"

Select all columns between x2 and x4 (inclusive).

#### df.iloc[:.[1.2.5]]

Select columns in positions 1, 2 and 5 (first column is 0).

## df.loc[df['a'] > 10, ['a','c']]

shift(1)

Select rows meeting logical condition, and only the specific columns

# **Summarise Data**

## df['w'].value\_counts()

Count number of rows with each unique value of variable

# of rows in DataFrame.

#### df['w'].nunique()

# of distinct values in a column

## df.describe()

Basic descriptive statistics for each column (or GroupBy)

pandas provides a large set of summary functions that operate on different kinds of pandas objects (DataFrame columns Series GroupRy Expanding and Rolling (see below)) and produce single values for each of the groups. When applied to a DataFrame the result is returned as a pandas Series for each column Examples:

median()

Sum values of each object.

#### min() Minimum value in each object.

count() Count non-NA/null values of each object

# Median value of

each object. quantile([0.25.0.75])

#### max() Maximum value in each object

mean() Mean value of each object

# Quantiles of each object

apply(function) Apply function to each object

#### var() Variance of each object

std() Standard deviation of each object.

# **Handling Missing Data**

Drop rows with any column having NA/null data.

# Make New Columns

# df assign(Area=lambda df: df Length\*df Height)

Compute and annead one or more new column

# df['Volume'] = df.Length\*df.Height\*df.Depth

pd.qcut(df.col, n, labels=False)

## Bin column into n buckets

pandas provides a large set of vector functions that operate on allcolumns of a DataFrame or a single selected column (a pandas Series). These functions produce vectors of values for each of the columns, or a single Series for the individual Series, Examples:

#### max(axis=1)

Flement-wise max

adf x1 x2 A 1 B 2 C 3

## min(axis=1) Flement-wise min

Vector

#### clip(lower=-10,upper=10) abs() Trim values at input thresholds Absolute value

# Combine Data Sets

B 2 Rows that appear

Rows that appear in both ydf and zdf

# pd.merge(ydf, zdf, how='outer')

pd.merge(ydf, zdf, how='outer', x1 x2

.drop(columns=['\_merge'])

Rows that appear in ydf but not zdf (Setdiff)

# Rows that appear in either or both ydf and zdf

.query('\_merge == "left\_only"')

#### df.groupby(by="col") The examples below can also be applied to groups. In this case, the function is applied on a per-group basis, and the returned vectors are of the length of the original DataFrame

Copy with values shifted by 1

Additional GroupBy functions

Return a GroupBy object, grouped by values in column named "col"

> df.groupby(level="ind") Return a GroupBy object, grouped by values in index level named "ind".

> > rank(method='min') Ranks. Ties get min rank. rank(nct=True) Ranks rescaled to interval [0, 1]

rank(method='dense')

Ranks with no gaps.

rank(method='first') Ranks. Ties go to first value. shift(-1)

Copy with values lagged by 1. cumsum() Cumulative sum cummax() Cumulative max

Cumulative min cumprod() Cumulative product

cummin()

# x1 x2 x3 dpd.merge(adf, bdf, how='left'. on='x1') Join matching rows from bdf to adf. x1 x2 x3 nd merge(adf hdf how='right' on='x1') Join matching rows from adf to bdf pd.merge(adf, bdf. how='inner', on='x1') B 2 F Join data. Retain only rows in both sets x1 x2 x3 pd.merge(adf, bdf, how='out how='outer'. on='x1') Join data Retain all values all rows

# **Filtering Joins**

adf[adf.x1.isin(bdf.x1)] All rows in adf that have a match in bdf.

adf[~adf.x1.isin(bdf.x1)] x1 x2 All rows in adf that do not have a match in bdf

Creative Commons Data Wrangling with Pandas by RStudio is licensed under CC BY SA 4.0

# **Data Wrangling with** dplyr and tidyr **Cheat Sheet**

# **Syntax** Helpful conventions for wrangling

## dplvr::tbl df(iris)

Converts data to thi class, this are easier to examine than data frames. R displays only the data that fits onscreen

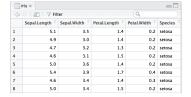

#### Source: local data frame [150 x 5] Sepal.Length Sepal.Width Petal.Length 4.9 3.0 1.4 4.7 3.2 1.3 4.6 3.1 1.5 5.0 3.6 Variables not shown: Petal.Width (dbl).

# Species (fctr) dplyr::glimpse(iris)

Information dense summary of tbl data.

#### utils::View(iris)

View data set in spreadsheet-like display (note capital V)

#### dplvr::%>%

Passes object on lef hand side as first argument (or argument) of function on righthand side.

x %>% f(y) is the same as f(x, y)v %>% f(x, .. z) is the same as f(x, v, z)

"Piping" with %>% makes code more readable, e.g.

## iris %>%

group\_by(Species) %>% summarise(avg = mean(Sepal.Width)) %>% arrange(avg)

# Tidy Data A foundation for wrangling in R

### In a tidy data set:

Tidy data complements R's vectorized operations. R will automatically preserve observations as you manipulate variables. No other format works as intuitively with R

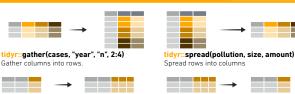

# BecomingHuman.Al

tidyr::unite(data. col, ..., sep)

Unite several columns into one

# Reshaping Data Change the layout of a data set

dplyr::data frame(a = 1:3, b = 4:6) Combine vectors into data frame (optimized).

dplyr::arrange(mtcars, mpg) Order rows by values of a column (low to high) dplvr::arrange(mtcars, desc(mpg))

Order rows by values of a column (high to low)

dplyr::rename(tb, y = year) Rename the columns of a data frame

# Subset Observations (Rows

tidyr::separate(storms, date, c("y", "m", "d"))

### dplyr::filter(iris, Sepal.Length > 7)

Extract rows that meet logical criteria

separate(storms, date, c("y", "m", "d")

### dplyr::distinct(iris)

Remove dunlicate rows

dplyr::sample\_frac(iris, 0.5, replace = TRUE) Randomly select fraction of rows

dplyr::sample\_n(iris, 10, replace = TRUE) Randomly select n rows

# dplyr::slice(iris, 10:15)

Select rows by position

## dplyr::top\_n(storms, 2, date)

Select and order top n entries (by group if grouped data).

	Logic in R - ?	Comparison, ?base	::Logic
<	Less than		Not equal to
>	Greater than	%in%	Group membership
	Equal to	is.na	Is NA
<=	Less than or equal to	!is.na	Is not NA
>=	Greater than or equal to	&, ,!,xor,any,all	Boolean operators

# Subset Variables (Columns

# dplyr::select(iris, Sepal.Width, Petal.Length, Species)

Select columns by name or helper function.

select(iris, contains("."))

Select columns whose name contains a character string.

select(iris, ends with("Length"))

Select columns whose name ends with a character string

select(iris, everything()) Select every column.

select(iris, matches(".t."))

Select columns whose name matches a regular expression.

select(iris, num\_range("x", 1:5))

Select columns named x1, x2, x3, x4, x5,

select(iris, one\_of(c("Species", "Genus"))) Select columns whose names are in a group of names.

select(iris, starts\_with("Sepal"))

Select columns whose name starts with a character string.

select(iris Senal Length Petal Width

Select all columns between Sepal.Length and Petal.Width (inclusive).

select(iris, -Species)

Select all columns except Species.

# **Group Data**

# dplyr::group by(iris, Species) iris %>% group\_by(Species) %>% summarise(...)

Group data into rows with the same value of Species.

dplyr::ungroup(iris) Remove grouping information from data frame.

# iris %>% group\_by(Species) %>% mutate(...)

# **Summarise Data**

dplyr::summarise(iris, avg = mean(Sepal.Length))

Summarise data into single row of values

dplyr::summarise\_each(iris, funs(mean)) Apply summary function to each column.

dplyr::count(iris, Species, wt = Sepal.Length)

Count number of rows with each unique value of variable (with or without weights).

Summarise uses summary functions, functions that take a vector of values and return a single value. such as:

dplvr::first First value of a vector

dplyr::last

Last value of a vector

dplyr::nth

Nth value of a vector. dnlyr"n

# of values in a vector

dplyr::n\_distinct # of distinct values in a vector.

IOR of a vector

Median value of a vector Variance of a vector.

mean

median

Standard deviation of a vector

Minimum value in a vector

Maximum value in a vector.

Mean value of a vector.

# **Make New Variables**

dplyr::mutate(iris, sepal = Sepal.Length + Sepal. Width) Compute and append one or more new columns

dplyr::mutate\_each(iris, funs(min\_rank)) Apply window function to each column

dplyr::transmute(iris, sepal = Sepal.Length + Sepal. Width)

Compute one or more new columns, Drop original columns

Mutate uses window functions, functions that take a vector of values and return another vector of values, such as:

dplvr::lead

Copy with values shifed by 1. Cumulative all dplvr::lag dplvr::cumany

Copy with values lagged by 1 Cumulative any dplyr::dense rank dplyr::cummean

Ranks with no gans

dplyr::min rank Ranks. Ties get min rank

dplyr::percent rank Ranks rescaled to [0, 1]

dplyr::row\_number Ranks. Ties got to first value.

dplyr::ntile Bin vector into n buckets

dplyr::between Are values between a and b?

dplyr::cume\_dist Cumulative distribution

# Cumulative prod Element-wise max

Cumulative mean

Cumulative sum

Cumulative max

Cumulative min

cumsum

cummax

cummin

cumprod

Element-wise min

# Combine Data Sets

>>> import numpy as np >> x = np.linspace(0.10.100)

>>> y = np.cos(x)

>> z = np.sin(x)

# 2D Data or Images

>>> data = 2 \* np.random.random((10, 10))

>>> data2 = 3 \* np.random.random((10, 10))

>>> Y, X = np.mgrid[-3:3:100j, -3:3:100j] >>> U = -1 - X\*\*2 + Y

>>> V = 1 + X - Y\*\*2

>>> from matplotlib.cbook import get\_sample\_data

>>> img = np.load(get\_sample\_data('axes\_grid/bivariate\_normal.npy'))

# **Create Plot**

>>> import matplotlib.pyplot as plt

# Figure

>>> fig = plt.figure()

>>> fig2 = plt.figure(figsize=plt.figaspect(2.0))

#### Axes

All plotting is done with respect to an Axes. In most cases, a subplot will fit your needs. A subplot is an axes on a grid system.

arrays cmap='gist\_earth', interpolation='nearest',

vmin=-2

>>> fig.add\_axes()

>>> ax1 = fig.add\_subplot(221) # row-col-num

>>> ax3 = fig.add\_subplot(212)

>>> fig3, axes = plt.subplots(nrows=2,ncols=2)

>>> fig4, axes2 = plt.subplots(ncols=3)

# **Customize Plot**

# Colors, Color Bars & Color Maps

>>> plt.plot(x, x, x, x\*\*2, x, x\*\*3) >>> ax.plot(x, y, alpha = 0.4)

>>> ax.plot(x, y, c='k')

>>> fig.colorbar(im, orientation='horizontal')

>>> im = ax.imshow(img, cmap='seismic')

#### Markers

>>> fig, ax = plt.subplots()

>>> ax.scatter(x,y,marker=".")

>>> ax.plot(x,y,marker="o")

# Linestyles

>>> plt.plot(x,y,linewidth=4.0)

>>> plt.plot(x,y,ls='solid')

>>> plt.plot(x,y,ls='--') >>> plt.plot(x,y,'--',x\*\*2,y\*\*2,'-.')

>>> plt.setp(lines,color='r',linewidth=4.0)

# **Text & Annotations**

>>> ax.text(1,

-2.1, 'Example Graph', style='italic')

>>> ax.annotate("Sine", xy=(8, 0), xycoords='data' xytext=(10.5.0).

textcoords='c arrowprops=dict(arrowstyle="connectionstyle="arc3").)

Mathtext

>>> plt.title(r'\$sigma\_i=15\$', fontsize=20)

**Vector Fields** 

>>> axes[1,1].quiver(y,z)

>>> axes[0.1].arrow(0.0.0.5.0.5)

**Data Distributions** 

# Limits, Legends & Lavouts

#### Limits & Autoscaling

>>> ax.margins(x=0.0,y=0.1)

Add padding to a plot

>>> ax.axis('equal') Set the aspect ratio

>>> ax.set(xlim=[0,10.5],ylim=[-1.5,1.5]) Set limits for x-and v-axis

>>> ax.set xlim(0,10.5) Set limits for x-axis

>>> ax.set(title='An Example Axes'. ylabel=

xlabel='X-Axis'

>>> ax.legend(loc='best') No overlapping plot elements

>>> ax.xaxis.set(ticks=range(1,5), ticklabels=[3,100,-12,"foo"]) direction=

Manually set x-ticks

Set a title and x-and

Make y-ticks longer and go in and out

#### **Subplot Spacing**

>>> fig3.subplots adjust(wspace=0.5 hspace=0.3 left=0.125. right=0.9, top=0.9, bottom=0.1

>>> fig.tight\_layout()

#### **Axis Spines**

>>> ax1.spines['top'=].set visible(False)

Make the top axis line for a plot invisible

>>> ax1.spines['bottom'].set\_position(('outward',10))

Move the hottom

# **Plotting Routines**

## 1D Data

>>> lines = ax plot(x v)

>>> ax.scatter(x.v)

>>> axes[0,0].bar([1,2,3],[3,4,5])

>>> axes[1.0].barh([0.5.1.2.5].[0.1.2]) >>> axes[1,1].axhline(0.45)

>>> axes[0,1].axvline(0.65) >>> ax.fill(x,y,color='blue') >>> ax.fill\_between(x,y,color='yellow')
2D Data

>>> fig. ax = plt.subplots()

>>> im = ax.imshow(img

Draw points with lines or markers connecting them Draw unconnected points, scaled or colored Plot vertical rectangles (constant width) Plot horiontal rectangles (constant height)

> Draw a horizontal line across axes Draw a vertical line across axes Draw filled polygons

> > Fill between y-values and 0

>>> plt.show()

# Close & Clear

>>> plt.cla()

>>> plt.clf() >>> plt.close()

# **Data Visualisation** with applot2 **Cheat Sheet**

# **Basics**

ggplot2 is based on the grammar of graphics, the idea that you can build every graph from the same few components: a data set, a set of geoms-visual marks that represent data points, and a coordinate system

To display data values, man variables in the data set to aesthetic properties of the geom like size color, and x and y locations

Build a graph with qplot() or qqplot()

# qplot(x = cty, y = hwy, color = cyl, data = mpg, geom = "point")

Creates a complete plot with given data, geom, and mappings. Supplies many useful defaults.

ggplot(data = mpg, aes(x = cty, y = hwy)) Begins a plot that you finish by adding layers to. No

defaults, but provides more control than gplot().

ggplot(mpg, aes(hwy, cty)) + geom point(aes(color = cvl)) + geom\_smooth(method ="lm") + coord cartesian() +

scale color gradient() theme bw()

Add a new layer to a plot with a geom\_\*() or stat\_\*() function. Each provides a geom, a set of aesthetic mappings, and a default stat and position adjustment.

#### last plot() Returns the last plot

#### ggsave("plot.png", width = 5, height = 5)

Saves last plot as 5' x 5' file named "plot.png" in working directory. Matches file type to file extension.

# **Coordinate Systems**

#### r <- b + geo m\_bar()

coord\_flip()

+ coord\_trans(vtrans = "sort")

xtrans, ytrans, timx, timy Transformed cartesian coordinates. Set extras and strains to the name

+ coord map(projection = "ortho" + coord\_maptprojection = ortho, orientation=c(41, -74, 0)) projection, orientation, xlim, ylim Map projections from the mapproj package (mercator (default), azequalarea, lagrange, etc.)

# Geom's Use a geom to represent data points, use the geom's aesthetic properties to represent variables. Each function returns a layer

# One Variable

# Continuous

geom\_histogram(binwidth = 5)

geom har() etype, size, weight

# **Graphical Primitives**

linejoin="round", linemitre=1) x, y, alpha, color, linetyna cizo 1 + geom\_ribbon(aes(ymin=unemploy - 900, ymax=unemploy + 900)) x, ymax, ymin, alpha, color, fill, linetype, size

+ geom\_segment(aes( xend = long + delta\_long, yend = lat + delta\_lat))

+ geom\_rect(aes(xmin = long, ymin = lat, xmax= long + delta\_long, ymax = lat + delta\_lat))

#### **Three Variables**

seals\$z <- with(seals, sqrt(delta\_long^2 + delta\_lat^2))
m <- qqplot(seals, aes(long, lat))</pre>

+ geom\_contour(aes(z = z)) geom\_raster(aes(fill = z), hjust=0.5, st=0.5, interpolate=FALSE)

geom\_tile(aes(fill = z))

# Faceting

Facets divide a nlot into subplots based on the values

+ facet\_grid(vear ~ .)

+ facet\_grid(year ~ fl)

t + facet\_wrap(~ fl)

Set erales to let avis limits vary across facets et\_grid(y ~ x, scales = "free")

x and v axis limits adjust to individual facets

"free\_x" - x axis limits adjust "free\_y" - y axis limits adjust

Set labeller to adjust facet labels t + facet grid( ~ fl labeller = label both)

fl:c fl:d fl:e fl:p fl:r rid(. ~ fl, labeller = label both) α<sup>c</sup> α<sup>d</sup> α<sup>e</sup> α<sup>p</sup> α<sup>r</sup>

t + facet\_grid(. ~ fl, labeller = label\_both) c d e p r

#### Two Variables

### Continuous X. Continuous Y

geom blank()

#### Discrete X, Continuous Y

g <- ggplot(mpg, aes(class, hwy)) geom\_bar(stat = "identity")

geom\_boxplot() Δė , ymin, alpha,

+ geom\_dotplot(binaxis = "v". stackdir = "center")

geom\_violin(scale = "area")

# Discrete X, Discrete Y

geom\_jitter()

### Continuous Bivariate Distribution

geom\_density2d()

# Continuous Function

geom line()

df <- data.frame(grp = c("A", "B"), fit = 4:5, se = 1:2)

geom\_step(direction = "hv")

geom\_pointrange()

+ geom\_map(aes(map\_id = state), map = map) +
expand\_limits(x = map\$long, y = map\$lat)
x x alpha color fill linetyne size

# **Position Adjustments**

Position adjustments determine how to arrange geoms that would otherwise occupy the same space

# s <- ggplot(mpg, aes(fl. fill = drv))

s + geom\_bar(position = "dodge")
Arrange elements side by side

s + geom\_bar(position = "fill")
Stack elements on ton of one another norm

geom\_bar(position = "stack")

f + geom\_point(position = "jitter")
Add random noise to X and Y position of each element to avoid overplotting

Each position adjustment can be recast as a function with manual width and height arguments

colorbar, legend, or none (no legend)

s + geom\_bar(position = position\_dodge(width = 1))

# Labels

t + xlab("New X label") Change the label on the X axis

t + ylab("New Y label") Change the label on the Y axis

Leaends

guides(color = "none")

t + labs(title =" New title", x = "New x", y = "New y")
All of the above

t + scale\_fill\_discrete(name = "Title", labels = c("A", "B", "C"))

theme(legend.position = "bottom")

Use scale functions to update legend

# f + stat\_unique() Themes

f + stat identity()

f + stat sum()

dparams = list(df=5))

Stats An alternative way to build a layer

e.q. a + geom\_bar(stat = "bin")

FMA

fl cty ctl

Some plots visualize a transformation of the original data set

Each stat creates additional variables to map aesthetics to. These

variables use a common ..name.. syntax. stat functions and geom

functions both combine a stat with a geom to make a layer, i.e.

i + stat\_density2d(aes(fill = ..level..), geom = "polygon", n = 100)

a + stat\_bin(binwidth = 1, origin = 10)

f + stat\_bin2d(bins = 30, drop = TRUE)

f + stat binhex(bins = 30)

m + stat contour(aes(z = z))

+ stat\_boxplot(coef = 1.5)

stat ecdf(n = 40)

+ stat ecdf(n = 40)

+ stat\_bindot(binwidth = 1, binaxis = "x")

f + stat\_density2d(contour = TRUE, n = 100)

m+ stat\_spoke(aes(radius= z, angle = z))

ggplot() + stat\_function(aes(x = -3:3), fun = dnorm, n = 101, args = list(sd=0.5))

f + stat summary(fun.data = "mean cl boot")

m + stat\_summary\_hex(aes(z = z), bins = 30, fun = mean)

g + stat\_ydensity(adjust = 1, kernel = "gaussian", scale = "area")

stat\_quantile(quantiles = c(0.25, 0.5, 0.75), formula =  $y \sim log(x)$ ,

f + stat\_smooth(method = "auto", formula = y ~ x, se = TRUE, n = 80, fullrange = FALSE, level = 1,95) x,y1.se, x, y1.se, x, y1

 $f + stat_quantile(quantiles = c(0.25, 0.5, 0.75), formula = y \sim log(x),$ 

f + stat \_smooth(method = "auto", formula = y ~ x, se = TRUE, n = 80, fullrange = FALSE, level = 0.95) xyl\_se\_x\_y\_\_\_mn\_\_\_man\_\_

ggplot() + stat\_qq(aes(sample=1:100), distribution = qt,

a + stat\_density(adjust = 1, kernel = "gaussian")

stat\_bin(geom="bar") does the same as geom\_bar(stat="bin")

Use a stat to choose a common transformation to visualize.

r + theme arev()

+ theme\_minimal()

ggthemes - Package with additional ggplot2 themes

# Scales

Scales control how a plot mans data values to the visual values of an aesthetic. To change the mapping, add a ustom scale.

n <- b + geom\_bar(aes(fill = fl))

n + scale fill manual(

values = c("skyblue", "royalblue". "blue". "navv") limits = c("d", "e", "n", "r"), breaks =c("d", "e", "n", "r")

name = "fuel", labels = c("D", "E", "P", "R"))

# **General Purpose scales**

scale\_\*\_continuous() - map cont' values to visual values scale\_\*\_discrete() - map discrete values to visual values scale\_\*\_identity() - use data values as visual values

scale\_\*\_manual(values = c()) - map discrete values to

#### X and Y location scales

scale\_x\_date(labels = date\_format("%m/%d"), breaks = date breaks("2 weeks"))

scale\_x\_datetime() - treat x values as date times. Use scale\_x\_log10() - Plot x on log10 scale scale\_x\_reverse() - Reverse direction of x axis

#### scale x sqrt() - Plot x on square root scale Color and fill scales

+ scale\_fill\_grey(

n + scale fill brewer palette = "Blues") For palette choices: display.brewer.all()

+ scale\_fill\_gradient( high = "yellow")

+ scale\_fill\_gradient2( low = "red", hight = "blue", mid = "white", midpoint = 25)

<- a + geom\_dotplot(

+ scale\_fill\_gradientn( colours = terrain.colors(6))

# Also: rainbow(), heat.colors(), topo.colors(), cm.colors(), RColorBrewer::brewer.pal()

## Shape scales

na.value = "red")

aes(shape = fl))
